Lao Tzu**

A Documentation Tip

The online GRIN-Global guides have a table of contents. The TOC entries are “clickable.” When you click on an item in the TOC, you should jump to that section in the guide.

Frequently Asked Questions

Question: How do I determine what codes are valid?

When adding records into the CT, some fields use a code. This ensures that valid data is entered. The fields are easily identifiable – in Edit mode, [Null] is displayed. For example:

Cooperator Wizard Crop Trait Wizard Inventory Attachment Wizard Order Wizard Viability Wizard

Get Order Request Action Get Order Request Item Get Accession Inventory Name Get Method Get Crop Get Crop Trait Observation

Accession Inventory Name ID	Accession	Inventory	Category	Name
-1			[Null]	

CGIAR International Center Identifier
CGIAR International Center Identifier
Collector identifier
Cultivar name
Developer identifier
Donor identifier
Duplicate accession name
Exploration identifier
Institute identifier
Local name
Misidentified cultivar name
Other or unclassified name
Plot
Quarantine identifier
Site identifier
Trademark name
Unverified name

When you open the dropdown, the valid codes are listed. Where do these codes come from? The organization that maintains the database (NPGS, NordGen, whoever...) determines what codes they

intend to use; *only* the GG database administrator (“DBA”) *can enter these codes into the database*. Codes can be created as needed, as determined by the organization.

Get Order Request Action Get Order Request Item Get Accession Inventory Name Get Method Get Crop Get Crop Trait Observation					
	Accession Inventory Name ID	Accession	Inventory	Category	Name
	-1			CGIAR International Center Identifier	

Copy Ctrl-C
Paste Ctrl-V
Delete Del

Practice!

Get Crop Trait Get Crop Trait Lang Get Crop Trait Code get_crop_trait_code_lang Get Taxonomy Crop Map Get Code Value Language Get Code Value					
	Code Value Lang ID	Code Value	Language	Title	Description
	13120	CONTACT_SUBJECT.ORDER	English	Germplasm Order Question	
	13119	CONTACT_SUBJECT.OTHER	English	Other Request	
	327	COOPERATOR_CATEGORY.FCOM	English	Foreign commercial company	Foreign commercial seed/biotech/chemical co
	328	COOPERATOR_CATEGORY.FGEN	English	Foreign genebank/genetic resource...	Foreign national genetic resources program or
	329	COOPERATOR_CATEGORY.FIND	English	Foreign individual no affiliation	Foreign individual without any organizational a
	330	COOPERATOR_CATEGORY.FPRU	English	Foreign non-commercial organization	Foreign public organizations such as universiti
	331	COOPERATOR_CATEGORY.INT	English	CGIAR International Agr. Res. Center	CGIAR International Agricultural Research Cen
	332	COOPERATOR_CATEGORY.STA	English	U.S. state agencies and all universit...	U.S. state agricultural experiment stations, uni
	333	COOPERATOR_CATEGORY.UAID	English	U.S. Agency for International Devel	

The Code Value column consists of two parts, the group (2) and the code (3). Shown here primarily are codes from the COOPERATOR-CATEGORY group. In the dropdown on the previous page, we saw the *titles* in the dropdown, not the *codes*. More on codes and languages will be discussed later.

Question: What is the difference between a dataview and a table?

As a user of data, when using the Curator Tool, you only see the data through the lens of dataviews. Some people may use the two terms “table” and “dataview” synonymously for the most part, that’s okay. Table = dataview. However, not really. In a database, data is stored in records in tables. But in the Curator Tool, we users see the data via a dataview; we don’t see the raw tables.

To make a distinction. The table is where data is stored in a database. A CT dataview displays data on the screen. An interesting sidenote: a dataview can be designed to show only part of a table’s data,

depending on the programmer's intent. A corollary statement – a CT dataview sometimes, and usually does, displays fields from more than one table.

Get Site	Accessions	Get Accession Action	Get Inventory Action	Get Accession Inventory Name	Get Accession Source	Get Accession Source Cooperator	Inventory	Get

The Accession ID is in gray is because as a user, you cannot change an ID field, even if you owned that particular record. However, the ID field is part of the record. Therefore, you cannot say "all fields in gray" are not in the table. Besides gray fields sometimes pointing to fields from other tables, a dataview gray field may be a calculated field. (The Inventory table has a **Pure Live Seed** field that is a calculated field.)

GG User Accounts

When working with GG, logging into the Curator Tool (CT) is essential for many internal genbank tasks. But consider after logging in to the CT, to launch the Public Website and login to it as well.

Note that it may seem that your PW user name is the same as your CT account, your email address, but it isn't. The UserName for the PW is separate from the CT UserName. Therefore, it is possible that the passwords are different, because they are really separate accounts. The organization's DBA can connect the two accounts, so that your public website account has special privileges which the ordinary PW user does not have. One of the privileges is described in the next section.

SQL Information

We haven't discussed yet using SQL. I include it here for those who might be interested. Skip to the next section unless you have time and are interested in learning how SQL queries can be run on the Public Website.

Remember to Log in to the Public Website. This account is different from the CT account. CT users with a PW account can then run SQL queries on the PW, as well as access internal reports that are unavailable to the external public users.

The SQL below will list all the Code Groups and Codes in the database. As shown below, you can copy this text into the Web Query box on the Public Website:

```
SELECT
  cv.code_value_id,
  cv.group_name as group_name,
  cv.value, cvl.title, cvl.description
FROM
  code_value cv
  LEFT JOIN code_value_lang cvl ON cv.code_value_id = cvl.code_value_id
                                AND cvl.sys_lang_id = 1
```

code_value_id	group_name	value	title
1	IMPROVEMENT_LEVEL	BREEDING	Breeding material
2	IMPROVEMENT_LEVEL	CLONE	Clone
3	IMPROVEMENT_LEVEL	CULTIVAR	Cultivar
4	IMPROVEMENT_LEVEL	CULTIVATED	Cultivated material

(6) Download, and save a copy in Excel! You now have a current copy of all the codes used in your organization's GRIN-Global database.

Remember that the GG database administrator (DBA) may add or delete codes at any time, based on the needs of the organization.

There is a dictionary online, a Google spreadsheet online, but it is generic and may differ from your organization's codes, or *may not be current*:

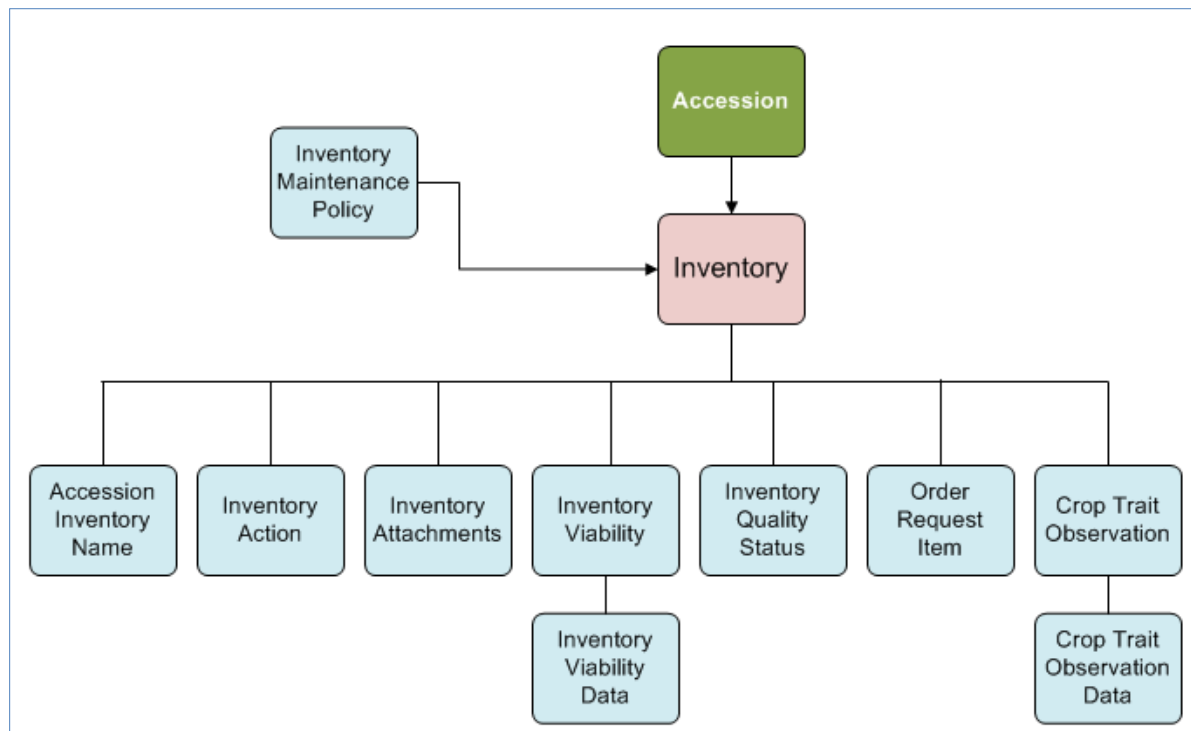

https://docs.google.com/spreadsheets/d/1QdVobmTov0Du0ad4k6JVtgPGiWME4IVK78VtXxZ9GJo/edit?hl=en_US&hl=en_US#gid=1660984974

The online document, SQL Library, at https://www.grin-global.org/docs/gg_sql_examples.docx has many handy SQL queries that are relatively easy to use. Generally, you copy from the SQL “as is” from the document and paste into the Query box on the Public Website. Try some out!

Inventory

The main inventory table is the parent to many children tables. In GRIN-Global, in the Curator Tool, we have many dataviews to facilitate the entering of data into the parent Inventory record and the children records – the Curator Tool is programmed to manage these relationships.

System Inventory Records

We mentioned that whenever an Accession record is created, a default inventory record is automatically created by GG. We refer to this default inventory record as the “system” inventory record. The “system” inventory record *does not* refer to physical inventory stored on a shelf or in a field somewhere.

Show lists from: **Reisinger, Martin, USDA, ARS**

PI List: **Solanum** **Vicuna** **Helianthus**

Vicuna Root Folder

- Vicuna
 - PHV_95001_mar
 - PHV_95002_mar
 - PHV 95002 mar **
 - PHV 95002 mar SD
 - PHV 95002 mar BD

Accessions	Acc.Name	Inventory	Inv.Name	Orders	Cooperators	Tax.Species	Crop	CropTrait	Obs
Inventory ID	Inventory Prefix	Inventory Number	Inventory Suffix	Inventory Type	Accession	Inventory Maintenance Policy			
3924881	PHV	95002	mar	**	PHV 95002 mar	SYSTEM			
3925195	PHV	95002	mar	SD	PHV 95002 mar	SYSTEM			
3925196	PHV	95002	mar	BD	PHV 95002 mar	Pistachio			

Three inventory records are displayed – the two I created, with the **Inventory Types SD** and **BD**, and the virtual inventory record. The virtual record will always have the ****** for **Inventory Type**.

Practice! Create several inventory records for at least one of your accessions.

Accessions										
Inventory										
Orders

	240883	SYSTEM	MAR 42 RRG	MAR	42	RRG	**	NORDGEN	N	N

In the left List Panel, use a folder (list) that either dynamically points to your accession records or list items that point to your accession records.

Take a few minutes to review the inventory dataview and the many inventory fields. The online document goes into detail about each field: https://www.grin-global.org/docs/gg_inventory.docx

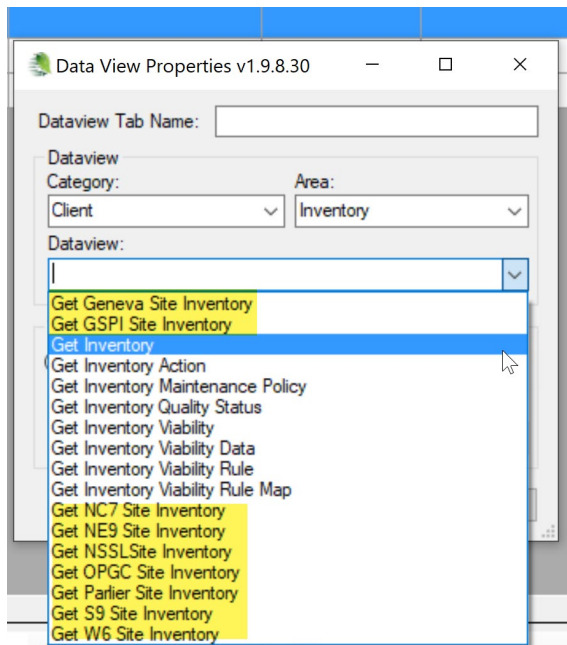

A reminder about a few points we discussed:

- when creating an inventory record, one of the required fields is the **Inventory Maintenance Policy**

Get Site Accessions Get Inventory Maintenance Policy Get Inventory Get Order Request Get Geography Get Accession Source Get Accession Inventory Name Get Sys Table Field Lang  ...											
Inventory Maint Policy ID	Maintenance Name	Form Type	Quantity On Hand Units	Web Availability Note	Is Auto Deducted?	Distribution Default Form	Standard Distribution Quantity	Unit of Distribution	Distribution Critical Amount	Replenishment Critical Amount	Regeneration Method
1	SYSTEM	**	[Null]		<input type="checkbox"/>	**		[Null]			[Null]
690	Humulus-RRG-SD	SD	count		<input checked="" type="checkbox"/>	SD	25.00000	count	2000.00000	5000.00000	[Null]
691	Humulus-RRG-CT	CT	count	Cuttings are seasonally available.	<input checked="" type="checkbox"/>	CT	5.00000	count	20.00000	50.00000	[Null]
692	Humulus-RRG-IV	IV	count		<input checked="" type="checkbox"/>	IV	3.00000	count	10.00000	20.00000	[Null]

- whoever owns the **Inventory Maintenance Policy**, will automatically own the new inventory record (owners can easily be changed later if necessary; we will learn how later)

- although the inventory record has many fields, most are optional
- each inventory record must have a unique identifier consisting of 4 fields:
Inventory -Prefix, -Number, - Suffix, and -Type
- an accession on the Public Website will be listed as “*Not Available*” unless the accession has an Inventory record which has fields set to “Y” – the **Is Default Inventory?** and the **Is Available?** fields

The highlighted dataviews were designed for specific sites in the USDA National Plant Germplasm System (NPGS). Your organization may or may not make these available. They can be used as is or copied by the DBA. When you have some time, open them and explore. This is something you should consider doing after you have used GG for some time and understand the schema better. You might decide to use a different inventory dataview rather than the standard **Get Inventory**.

Another point to make here is that it is relatively easy to have custom dataviews. Usually, an organization should use and test the GG database with its dataviews first to determine their specific needs.

Two Very Important Inventory Y/N Fields to Consider

An accession is considered *available*, that is, the accession can be added to the shopping cart, when it has at least one inventory record with two specific fields set to “Y”:

- **Is Default Inventory?**

Accessions	Inventory	Inventory Action	Orders	Cooperators	Inventory Maintenance Policy	Get Inventory Viability	Source Descriptor	Source Des	
	Inventory Suffix	Inventory Type	Accession	Inventory Maintenance Policy	Inventory Maintenance Site	Is Default Inventory?	Is Auto Deducted?	Is Available?	Availability Status
	SD	MAR 102101 rei	MAR-RIBES	DBMU	Y	Y	Y	Available	
	SD	MAR 102102 rei	MAR-RIBES	DBMU	Y	Y	N	No value specified	

The code value in the **Availability Status** field does not determine the availability.

Fieldnames named with a question mark, for example **Is Available?**, can have a value of either **Y** or **N**. In Edit mode, the fields display as checked or unchecked.

Accessions	Inventory	Inventory Action	Orders	Cooperators	Inventory Maintenance Policy	Get Inventory Viability	Source Descriptor	Source Des	
	Inventory Suffix	Inventory Type	Accession	Inventory Maintenance Policy	Inventory Maintenance Site	Is Default Inventory?	Is Auto Deducted?	Is Available?	Availability Status
	rei	SD	MAR 102101 rei	MAR-RIBES	DBMU	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Available
	rei	SD	MAR 102102 rei	MAR-RIBES	DBMU	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	No value specified

 Search for more accessions

Practice! Experiment. Using your inventory record where you own the record (because you also owned the [Inventory Maintenance Policy](#) with which it relates to), go back and forth between the CT and the PW to see what happens when you change the two flag fields, Is_Default? and Is_Available? Set both to Y, then set one or the other to N, and so on.

Get Site	Accessions	Get Accession Action	Inventory	Get Inventory Action	Get Accession Inventory Name	Get Accession Source	Get Accession Source Cooperator	Get Accession Ir		
Inventory ID	Inventory Prefix	Inventory Number	Inventory Suffix	Inventory Type	Accession	Is Default Inventory?	Is Auto Deducted?	Is Available?	Availability Status	Parent
1230403	PI	615112	85ncao01	SD	PI 615112	N	Y	N	Original lot received	
1230404	PI	615112	86ncal01	SD	PI 615112	N	Y	N	Reference lot	PI 615
1944105	PI	615112	95ncal01	SD	PI 615112	N	Y	N	Bulked into a new lot with others	PI 615
2121284	PI	615112	96ncal01	SD	PI 615112	N	Y	N	Bulked into a new lot with others	PI 615
2185329	PI	615112	97ncab01	SD	PI 615112	Y	Y	Y	Available	PI 615

Note: The **Is Auto Deducted?** field plays an interesting function, actually two functions. When an order is filled, and the seed is used, the Order Wizard will subtract the amount used against the original amount total to update the Qty on Hand. If this **Is Auto Deducted?** field is set to Y, it will also use a trigger to switch the Availability Status from "Available " to "Low Inventory" when the amount subtracted from the **Qty on Hand** takes the new quantity to be less than the **Distribution Critical Amount**.

Inventory Fields Before and After the Order is Filled

In the following example, the amount being distributed takes the Inventory **Quantity on Hand** level below the **Distribution Critical Amount**:

Fields	Value	Action
Quantity on Hand	80	
Distribution Critical Quantity	70	
Availability Status	Available	
Is Auto Deducted?	Y	
Standard Distribution Quantity	25	
		Order is Filled (standard quantity is shipped)
Quantity on Hand	55	
Availability Status	Low	
Is Available?	Y	

Managing Workflow by recording Inventory Actions

GG has several action tables – **Accessions Actions**, **Inventory Actions**, and **Order Actions**. Actions can be recorded in the respective tables to denote when a specific task has been started or completed, in some cases, both the start and completion dates.

Practice!

Open the **Inventory Action** dataview in the Search Tool, and search for some action records. Since there are many, be sure you have a reasonable number as the maximum number for the **Limit**:

Search Results							
Add To Query		Clear Query		Limit: 200		Page Size: 100	
Get Accession Inventory Name		Get Accession Source		Inventory Maintenance Policy		Get Inventory Action	
						Show All Columns	
	*						
	Inventory Action ID	Inventory	Action Name	Start Date Format	Start Date	Completed Date Format	Completed Date
	43	EST2669 1 1 SD	Stored	dd/mm/yyyy	4/28/2010	dd/mm/yyyy	4/28/2010
	44	EST267 1 1 SD	Planted	dd/mm/yyyy	3/1/1999	dd/mm/yyyy	3/1/1999
	45	EST267 1 1 SD	Received	dd/mm/yyyy	3/1/1999	dd/mm/yyyy	3/1/1999
	46	EST267 1 1 SD	Stored	dd/mm/yyyy	6/10/1999	dd/mm/yyyy	6/10/1999

Practice!

Inventory Practice

Use one of your accessions that you created in an earlier exercise.

- Create two **Inventory** records for that accession.

Remember that when creating any new records, in Edit mode, the violet color in the cell indicates that that field is required.

- Create several **Accession Inventory Name** records. Then search in the Public Website for the related accession, and review its detail page to determine if the names are visible.
- Highlight the **Accession** item in the List Panel. Practice switching between the dataviews: **Accession**, **Inventory**, **Inventory Name**, and **Inventory Action** dataviews.

Parent Inventory Records

Ideally, for any accession, the lineage / parentage should be known. Where did the accession come from? Was it collected? Did someone donate it? Did a breeder develop it? These questions can usually be answered by looking at the **Accession Source** records.

But how does GG handle inventory, especially ongoing? That is, typically a genebank must grow out more seeds to increase the number of seeds available. This new harvest is a new generation. Genebanks keep these generations separate, and every genebank has their own unique method for naming the generations. But not getting into naming conventions here, there is one thing all of the GG users should be doing: tracking the parent inventory. The seeds from “Jar 1” are sitting on the shelf. Use 250 seeds from the jar, plant them, and harvest. In GG, these seeds should go into “Jar 2.” The seeds in Jar 2 get their own inventory record, and in that record, the **Parent Inventory** field should point back to the inventory that was in Jar 1.

Get Site	Accessions	Get Accession Action	Inventory	Get Inventory Action	Get Accession Inventory Name	Get Accession Source	Get Accession Source Coo
Inventory ID	Inventory Prefix	Inventory Number	Inventory Suffix	Inventory Type	Accession	Parent Inventory	Backup Inventory
1230403	PI	615112	85ncao01	1	SD	PI 615112	
1230404	PI	615112	86ncal01		SD	PI 615112	PI 615112 85ncao01 SD
1944105	PI	615112	95ncal01		SD	PI 615112	PI 615112 85ncao01 SD
2121284	PI	615112	96ncal01		SD	PI 615112	PI 615112 85ncao01 SD
2185329	PI	615112	97ncab01	2	SD	PI 615112	PI 615112 85ncao01 SD
2309899	NSSL	387432	01		SD	PI 615112	PI 615112 97ncab01 SD
4029232	PI	615112		**	PI 615112		

Backup Inventory

In the example above, the 6th record has the Backup Inventory field filled. This tells us that this batch of seeds is the backup of the seeds shown in the 5th row (2).

Note: This “suffix” naming convention was developed by the NC7 site at Ames, Iowa. In the Inventory Guide, there is an appendix that illustrates some other naming conventions.

[https://www.grin-global.org/docs/gg_inventory.pdf]

The NSSL prefix is used exclusively at the NPGS backup site at Fort Collins. Accessions throughout NPGS are backed up and these backup samples are housed at Fort Collins and not generally distributed. NPGS also has backups that are sent to the Svalbard vault.

Germplasm Requests

Handling Incoming Web Order Requests

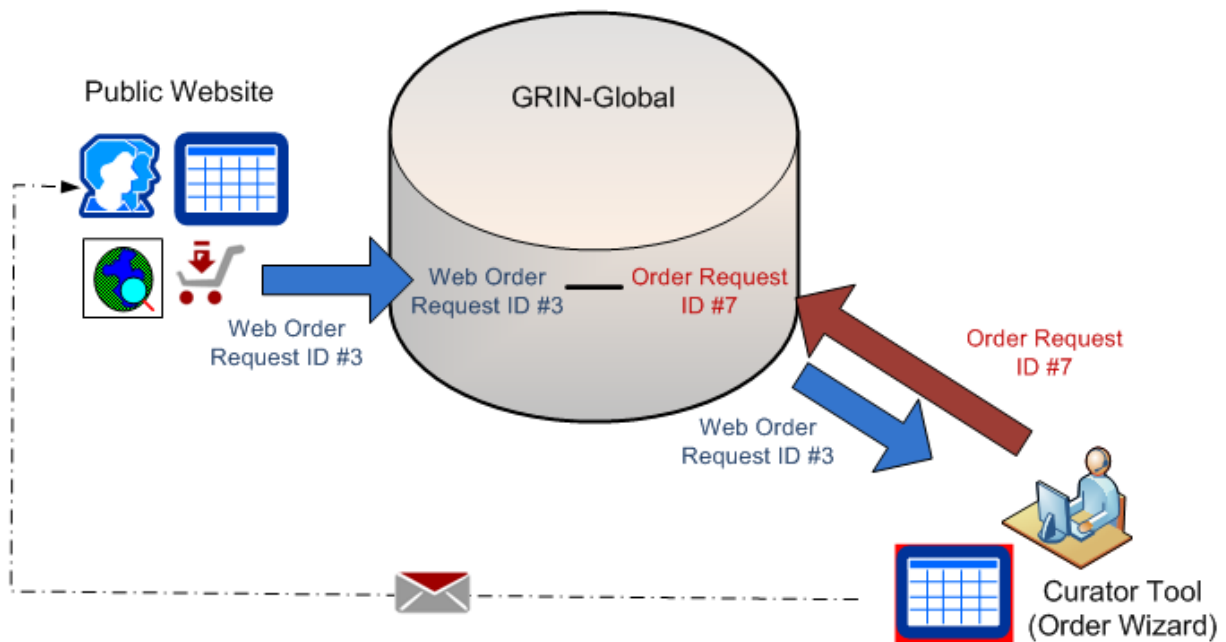

Public Website requestors can search for accessions that meet specific criteria and then request them via the PW. When the PW submits their request, it is sent to the genebank hosting the GG site. The GG software evaluates the requests and sends emails to the sites that maintain the germplasm that was requested in the web order request (WOR).

(As an aside, requesting germplasm may be a bit too easy – hence the NPGS for example receives many requests from home gardeners and others who should be using commercially available seeds. That’s a whole other discussion. But NPGS recently interjected a review step before the request is distributed to its various sites.)

Practice! By now you should have one or more accessions that have physical inventory. If they have physical inventory (**Qty on Hand**) and you have the two fields set to “Y,” (remember the **Is Default?** and **Is Available?** fields – see [Yes/No](#) if you don’t), then the accession can be ordered.

Public Web Orders to Orders Conversion (Diagram)

The illustration above shows the requestor submitting the web order request (WOR) and then it being processed by the genebank staff person. For this exercise, start at the Public Website. Search for your accessions and select them, add to the shopping cart; follow through and submit your request. Note the WOR number in the confirmation.

Switch over to the Curator Tool, start up the Order Wizard and search for the WOR number. Check out the video before proceeding. It demonstrates what is involved in converting the web cooperators data into standard cooperator records. The process of selecting the cooperators is a bit tricky until you do it several times.

See <https://www.ars-grin.gov/npgs/gringlobal/videos/orderwiz2.mp4>

We will review the order fulfillment process again in webinar 4, but if you have any questions, as always, email the instructor!

We actually never reviewed everything yet regarding the order wizard. For your reading pleasure, there are two order-related documents online:

Order Processing: https://www.grin-global.org/docs/gg_order_processing.pdf

Order & Cooperator Wizards v1.9.9.4+

https://www.grin-global.org/docs/gg_order_and_cooperator_wizard_v1.9.9.4.pdf
